

Lab 7 - Full SOC Incident Investigation

Case INC-007 - Evidence-Led Triage and Endpoint Remediation

Attribute	Details
Case ID	INC-007
Date	29 September 2026
Environment	Windows 11 VM + Ubuntu-hosted Wazuh SIEM
Endpoint	Wazuh agent 005 - Windows11-SOC-Lab
Final disposition	Authorized test activity; EICAR quarantined; no real intrusion established

1. Executive Summary

The exercise examined Windows Security Events 4625 and 4624, PowerShell Script Block Event 4104, and Microsoft Defender Events 1116 and 1117 forwarded to Wazuh. Authentication and PowerShell data demonstrated telemetry coverage, while the EICAR test validated endpoint detection and remediation.

Interpretation boundary: the activities were separate, deliberately generated lab tests. They do not establish a causal attack chain, confirmed malicious PowerShell execution, lateral movement, or genuine malware infection.

2. Evidence Timeline

UTC Time	Telemetry	Observation
03:06:21	Security 4625	Failed local interactive sign-in; Logon Type 2; localhost; Wazuh level 5.
03:06:31	Security 4624	Successful workstation unlock; Logon Type 7; Wazuh level 3.
03:37:31	PowerShell 4104	Security-policy query; Wazuh rule 91816, level 4.
04:27:42	Defender 1116	EICAR detected; Wazuh rule 62123, level 12.
04:28:37	Defender 1117	Quarantine completed; Wazuh rule 62124, level 3.

3. Technical Findings

- Authentication: controlled local failures were followed by a successful unlock; no evidence of remote brute force.
- PowerShell: Event 4104 confirmed Script Block Logging and Wazuh collection; automated ATT&CK tags were not treated as proof of malicious intent.
- Endpoint detection: Defender identified Virus:DOS/EICAR_Test_File at C:\SOC-Lab\eicar-test.com.
- Remediation: Event 1117 recorded Quarantine, NT AUTHORITY\SYSTEM, error 0x00000000, operation completed successfully.

4. Detection and Response Assessment

Question	Finding
Was the file identified?	Yes - EICAR test signature, Defender Event 1116.
Was remediation successful?	Yes - Event 1117 and Protection History confirmed quarantine.
Evidence of live compromise?	No - activity was controlled and authorized.
Action required?	Preserve sanitized evidence and close as authorized test activity.

5. Analyst Closure

Disposition: Authorized SOC lab exercise; successfully detected and remediated test artifact. Skills demonstrated include Windows event analysis, SIEM ingestion verification, event correlation, endpoint triage, qualified ATT&CK interpretation, and evidence-based incident documentation.

6. Conclusion

The case validated the full monitoring path from endpoint telemetry through SIEM review and endpoint remediation while maintaining clear boundaries between controlled test evidence and claims of a real intrusion.
