

Full SOC Incident Investigation

Case INC-007 | 29 September 2026 | Evidence-led triage and endpoint remediation

Case attribute	Recorded scope
Environment	Windows 11 VM; Ubuntu-hosted Wazuh all-in-one SIEM
Endpoint	Wazuh agent 005, Windows11-SOC-Lab (host DESKTOP-ICS24PI)
Objective	Investigate controlled authentication, PowerShell, and antivirus events; correlate detection and remediation.
Final disposition	Authorized test activity. EICAR test file successfully quarantined. No real intrusion established.

1. Executive summary

This exercise examined Windows Security events 4625 and 4624, PowerShell Script Block event 4104, and Microsoft Defender events 1116 and 1117 forwarded to Wazuh. Authentication and PowerShell data demonstrated telemetry coverage. A safe EICAR antivirus test file was written locally and detected by Microsoft Defender. Wazuh received the detection and subsequent successful quarantine events from the same endpoint.

Interpretation boundary: These activities were separate, deliberately generated lab tests. A phishing scenario referenced in previous training was simulated text, not a delivered or clicked email. The observations do not establish a causal attack chain, confirmed malicious PowerShell execution, lateral movement, or genuine malware infection.

2. Scope and sources

Evidence used: user-exported Wazuh event fields for Security 4625/4624, PowerShell 4104, and Defender 1116/1117; local PowerShell event-log screenshot; Windows Security Protection History screenshot. Times below use original event systemTime in UTC unless specified. Personal Microsoft account identifiers are intentionally omitted.

3. Evidence timeline

Time (UTC)	Telemetry	Observation
03:06:21	Security 4625	Failed local interactive sign-in; logon type 2; localhost 127.0.0.1; Wazuh rule 60122, level 5.
03:06:31	Security 4624	Successful workstation unlock; logon type 7; Wazuh rule 67022, level 3.
03:37:31	PowerShell 4104	Security-policy query using secedit /export and ResetLockoutCount lookup; Wazuh rule 91816, level 4.
04:27:42	Defender 1116	Real-time detection of EICAR file; Wazuh rule 62123, level 12.
04:28:37	Defender 1117	Quarantine performed successfully; Wazuh rule 62124, level 3.

The 1116 and 1117 events share detection ID 3A3E99E1-3072-48A0-9AF4-FB83D5896B48. Remediation was logged approximately 55 seconds after detection. Wazuh local display time was around 09:57:43 and 09:58:37, respectively (UTC+05:30).

4. Technical findings

Authentication: The 4625 test was a local failed sign-in (logon type 2), followed approximately ten seconds later by a successful unlock (4624, logon type 7). This does not substantiate remote brute-force activity. Wazuh automatic technique tags

should not be accepted as proof without underlying behavioral evidence.

PowerShell: Windows Script Block Logging was enabled and agent configuration included Microsoft-Windows-PowerShell/Operational. Wazuh indexed event 4104 for a script querying local security-policy settings. Wazuh rule 91816 applied ATT&CK T1082 (System Information Discovery); this is an automated classification, not proof of malicious intent. The harmless INC-007 command appeared in Windows local logs but was not found as a separate Wazuh alert via the INC-007 text search; a non-alerting script block may not appear in Threat Hunting.

Endpoint detection: Event 1116 reported Virus:DOS/EICAR_Test_File at C:\SOC-Lab\icar-test.com, originating on the local machine from real-time protection; associated process powershell.exe. EICAR is an antivirus test string, not actual malware. The event was indexed by agent 005 and Wazuh rule 62123 (level 12).

Remediation: Event 1117 for the same detection ID recorded Action: Quarantine, remediation user NT AUTHORITY\SYSTEM, error 0x00000000, and operation completed successfully. Wazuh rule 62124 (level 3). Windows Security Protection History independently displayed Threat quarantined. Event 1116 alone demonstrates detection; Event 1117 and Protection History support the remediation finding.

5. Detection and response assessment

Question	Analyst finding
Was the file identified?	Yes: EICAR test signature, Defender event 1116.
Was the response successful?	Yes: Defender event 1117, Quarantine, error 0x00000000; Windows Protection History confirms.
Is there evidence of live compromise?	No. Observed actions were controlled exercises; no causal linkage or unauthorized access established.
Action required?	Retain quarantined test file; do not restore or allow it. Preserve sanitized evidence and close case as authorized test.

6. Evidence appendix

Figure 1. Local PowerShell Event ID 4104 verification screenshot supplied during the exercise.

Figure 2. Windows Security Protection History showing EICAR threat quarantined at C:\SOC-Lab\icar-test.com.

Wazuh detection and quarantine records were provided as copied expanded-event fields; no Wazuh screenshots were supplied for those two events. This report records their observed field values without claiming otherwise.

7. Analyst closure

Disposition: Authorized SOC lab exercise; successfully detected and remediated test artifact. **Skills demonstrated:** Windows event analysis, SIEM ingestion verification, event correlation, endpoint triage, ATT&CK mapping with appropriate qualification, and evidence-based incident documentation. **Limits:** This case should not be represented as an actual breach or an end-to-end attacker intrusion.
